

Reviewing a style — the outputs

What the Review screen shows you, what every status means, and exactly which buttons are yours. No technical knowledge needed.

You reach this screen by opening a card on **My tasks** or **Reviews** and pressing **Start review** / **Finish review** — or from a style's page via **Review & decide**.

Your two levers

On this screen you only ever do two things: ✓ **Approve** a document that's correct, or ✗ **Reject** one that isn't (with a short note saying why). You don't edit data or re-generate documents from here — if something's wrong, you reject it with a note, and a short how-to is further down.

1 The header — how many outputs are ready

The top of the screen tells you which style you're reviewing and, at a glance, how many of its documents are ready for you and where each one stands. This is your “X of Y outputs ready”.

- Which style you're reviewing** — its number and name. “← Back to style” returns to the style's own page (where all its data lives).
- The readiness summary.** First the **total** number of documents (here **6 outputs**), then a running tally of where each one stands. Here: 3 already approved, 2 still waiting for your decision (“to review”), and 1 blocked. You'll only ever see the labels that apply — the full set is: **approved** **rejected** **to review** **blocked** **generating** **not generated**.
- “In review · you”** appears once you've started. It marks this style as **yours, in progress**, so it stays on your **My tasks** until every document is decided. If someone else started it first, you'll see their name here instead.

2 The outputs, grouped by type

Documents are grouped into **accordions** by what they are — Carton print, Care label, Hangtag, and so on. Click a group's header to open or close it.

- The group header shows the **document type**, how many documents it holds (the number in brackets), and a **mini-tally for that group only** — a quick way to see which kinds of document still need you.

- 5 Click anywhere on a header to **open or close** it. An open group lays out each document as a card — that's the next section.

3 An output card, opened

Each document is a card. Open the group and you can see the actual PDF and decide on it without leaving the page.

- 6 The document's **name**, with its exact **file name** just beneath it (in monospace).
- 7 “**Open** ↗” opens the PDF in a new browser tab — handy for zooming in or viewing it full-screen.
- 8 The **inline PDF preview**. The same document is shown right here — scroll it to read the whole thing without opening a tab.
- 9 Your **decision buttons**. **✓ Approve** marks the document correct. **✗ Reject...** opens a box to type what's wrong (a note is required) before it's sent back. Both are available to you as a reviewer.

4 What each status looks like

A document is always in one of these states. Here's how each one appears on its card.

2 outputs contain placeholder artifacts — approval is blocked. Dashed “missing artwork” tiles or “No carton EAN” boxes are review-safe but must never ship to print. Fix the gaps and re-run the output.

This red banner sits at the top of the screen whenever any document is blocked, so you can't miss it.

5 When something's missing or not generated yet

Not every document is always ready. Two cases you'll meet — and in both, your

move is the same: reject with a note (or chase the data), not “fix it yourself”.

“Not generated yet” lists documents that haven't been produced. If a document is *awaiting data*, the **exact missing fields** are spelled out. If you need one of these, that's your cue to chase the missing data so it can be generated.

A **placeholder inside a generated PDF** — a dashed “missing artwork” tile or a “No carton EAN” box. The document still renders so you can sanity-check the rest, but **Approve is locked**. Reject it with a note so the data can be fixed and the document re-run.

6 Rejecting a document

Say what's wrong, in one box

When a document isn't right, press **X Reject...** and type a short note. Your comment is saved to the **rejection log** with full context — customer, business area, order, and which document — so the underlying data can be fixed and the document re-run. The corrected version then comes back to you as a fresh review.

The reject box. A note is required — it's what turns a rejection into something actionable.

7 Finishing up — and not losing a half-done review

When you're confident, you can clear a whole style quickly. And the screen actively protects you from forgetting a review you've half-finished.

- 10 **Approve all / Reject all** act on every *pending* document at once. Blocked ones are skipped automatically — you can't bulk-approve something that isn't print-safe.
- 11 The moment the **last** document is decided and approved, the style is **published**: the documents are sent on to the supplier and the style's status flows back to **Monday automatically**. Until then, nothing leaves.
- 12 If you wander off mid-review, the app reminds you and keeps the style **waiting on your My tasks** so it can't be forgotten (dialogs below).

Start reviewing this prod spec?

Finish this review before you go?

Pressing yes marks this review as **in review by you** — it stays on your My tasks until every document is approved or rejected, so a half-finished check can't be forgotten.

Not yet

Yes — start review

You've decided **3 of 6** documents. **Nothing is sent to the supplier until every document is approved or rejected** — if you leave now, this review stays open and lands on your My tasks page.

Leave — it'll wait on My tasks

Keep reviewing

Rule of thumb. Approve what's print-ready. Reject anything with a placeholder or a mistake — and say why. Everything you decide is tracked, and the supplier only ever sees a **fully-approved** style.
