

Attaching a document to a style

Some packaging lines on a cover page are supplied by hand rather than produced here. This is where the actual file goes — one drop zone per line, labelled exactly as the cover labels it.

Open a style, then the **Prod Spec** tab — the section called **Manually supplied packaging**, just above **Prod Spec runs**.

1 What a manually supplied line is

The cover page lists everything the order's trims column asks for. Some of those lines this app produces itself — the care label, the carton marking, whatever layouts the client has. The rest it doesn't, and the cover says so: **manually supplied**, with the status column reading "Waiting for Customer Information".

The cover has already told the supplier to expect that document. This screen is where you put it. Dropping a file here places it in the same **APPROVED LAYOUTS** folder the generated outputs land in, and flips that line on the cover from waiting to approved.

Only lines the cover is actually printing get a zone

The labels come from the very same list the cover renders, so nothing here is re-typed or paraphrased. If the cover says "Wash Care Label with Oeko-tex Logo", so does the zone — that identity is how you tell which file belongs in which box.

It follows that a line the cover isn't printing has no zone. If a style has nothing manually supplied, the section says so: *every packaging line is produced here*. And if trims on the cover page are switched off entirely, no cover lists a manual line at all, and the section tells you that instead.

2 The drop zones

- 1 **Each zone is headed with the cover's own wording**, verbatim — not shortened, not re-cased. Match it against the printed page and you cannot put a file in the wrong box.
- 2 **Not supplied** — nothing here yet, and the cover is telling the supplier to wait for it.
- 3 **In the supplier folder** — the file reached SharePoint. Only then does the cover say the line is approved. A middle state, **Saved, not in the folder**, means the app is holding your file but it hasn't reached the folder yet — the reason is shown on the card.
- 4 **Two names**. The bold one is what you uploaded — click it to open your own copy. The small grey one is the name it was given in the supplier's folder, built so two styles on one order can never overwrite each other. **Open in SharePoint** goes to the delivered file.

- 5 **To replace a file, drop a new one on the same zone.** It overwrites — you never end up with two files fighting over one line. **Remove** takes it back out.

Accepted: PDF, AI, EPS, SVG, PNG, JPG and the other artwork and office formats a studio actually sends — up to 4 MB. Anything else is refused rather than delivered under a name whose type we can't trust.

3 When the cover catches up

A cover already generated keeps its words until it is rebuilt

A bundle generated **after** the upload carries the new status straight away. One that already exists — including one already sitting in the supplier's folder — still says "Waiting for Customer Information" until it is rebuilt.

The **Regenerate cover pages** sweep on **Settings ▶ Cover page** now sees this style as changed and will rewrite it. For a single order in a hurry, **Regenerate a style** on the same screen does it immediately — guide 4.

4 When a trims list changes underneath you

If the order's trims column changes after you have uploaded something, a file can be left behind: still in the supplier's folder, no longer on the cover. Those are collected in their own amber box.

No longer on the cover — still in the supplier's folder

The Trims column changed since these were uploaded. Remove them unless the supplier should still have them.

Gift box insert · 4471-navy-gift-box-insert-88123456.pdf

Remove

Nothing is removed for you — the supplier may well still need the file. It is surfaced so the decision is yours.

5 Who can do this

Anyone who can review

Reviewers and admins alike. It sits on a tab reviewers already reach, and the routes behind it use the same permission — because chasing a missing hangtag artwork is reviewer work, not configuration.

A useful check: a document line stuck at "Waiting for Customer Information" on a cover you are reviewing usually means exactly this — nobody has attached the file yet. Open the style's Prod Spec tab, find the zone with the same heading, and drop it in.
