

General information, and re-issuing one order

The requirements pages that print inside every bundle, written per client and business area — and the two ways to push a change out to bundles that already exist.

Settings ▶ **Cover page** ▶ **General information** — the middle of three tabs, beside **Cover page (all clients)** and **Packaging rows** (guide 3). Reviewers own this prose, so this is the one Settings screen in a reviewer's sidebar.

1 Where this text ends up

A bundle opens with the **cover page** block, which is the same for every client. General information comes straight after it, inside the same cover PDF — and unlike the cover block, there is **one set per client and business area**. Quality standards, AQL tables, packing requirements: whatever this client needs to say on every order.

The screenshot shows a web browser window with the address bar displaying 'prod-spec.app / settings / cover-page?tab=general-info'. The page title is 'Cover page' with a subtitle 'The text every bundle carries in front of the layouts.' Below this are three tabs: 'Cover page (all clients)', 'General information' (selected), and 'Packaging rows'. A dropdown menu for 'Client & business area' is set to 'Acme Apparel · Kids'. The main content area is divided into two sections. The left section, titled 'Content', has a toolbar with 'H1', 'H2', 'H3', 'B', 'I', 'List', 'Quote', 'Table', and 'Image' icons, and a 'Visual' button. Below the toolbar is a 'Markdown' button. The right section, titled 'General information preview', shows a 'PDF' preview of the 'General requirements' section. The 'General requirements' section in the editor contains a bulleted list: 'Garments must comply with the client's restricted substance list.', 'Max shrinkage: -2 / +5 %.', and 'Prints and heat transfers must be 100 % PVC free.'.

- 1 Pick the client and business area first.** Everything you type belongs to that pairing and to no other — the same client's other business areas have their own text.
- 2 It auto-saves as you type.** There is no Save button and no draft: what you leave on screen is what the next bundle prints.
- 3 Visual or Markdown.** Write with the toolbar, or switch to Markdown and type it — # and a space for a heading, — and a space for a list. Tables and images insert from the toolbar.
- 4 The preview is the printed page,** refreshed after each auto-save. Check tables here: they are the thing most likely to look different on paper than in the editor.

2 Saving affects bundles generated from now on

Existing bundles keep the text they were built with

A cover PDF is rendered when a bundle is generated and then frozen. Editing this text does not reach back into bundles that already exist — including any already delivered to a supplier. They keep their old wording until something rebuilds them.

That is usually what you want. When it isn't, there are two tools directly below the editor, and the difference between them is scope.

Regenerate a style

- One style number, across every order carrying it.
- For “this order went out with the wrong text”.
- Section 3.

Apply to existing bundles

- Every style under the client and business area you have open.
- For a wording change everybody should see.
- Section 4.

3 Regenerate a style

Type a style number, see exactly which orders carry it, then rebuild those covers and push them straight back into the suppliers’ folders — replacing the copy each supplier holds now.

A style number is not one order

The same number normally appears several times — once per purchase order, and once per colourway. Correcting “that style” means all of them, so the search names every match and the run works through the whole list. “Found 4, fixed 1” would leave three suppliers on the old PDF while the app read as done.

Regenerate a style

Each style’s cover PDF is rebuilt with the General information of the client it belongs to, and pushed back to its supplier’s folder. Nothing else is touched: no other style, no outputs, no approvals.

Style number:

Find style

3 styles carry that number — the same style number appears once per order and once per colourway. All of them are corrected together. 1

☒	4471	Acme Apparel	100423	Northwind Knitwear	APPROVED
☒	4471	Acme Apparel	100511	Delta Garments	IN_REVIEW
☐	4471	Nordvest Retail	no PO number		DRAFT

Never generated a bundle, so there is no cover to rebuild. It will include the current General information the first time it generates. 2

2 styles will have their cover PDF rebuilt and re-uploaded, replacing the copies the suppliers have now. Outputs are not re-rendered and approvals are untouched.

☐ **Also email the suppliers** about it in tonight’s digest. Off by default — the corrected files reach their folders either way. 3

Regenerate and re-upload 2 styles

Cancel

- 1 **Nothing runs until you have seen the list.** Every match is named with its client, PO number, supplier and status while the button is still unpressed — this overwrites files in suppliers’ folders, and that should never be a surprise. All of them are ticked by default; untick any you don’t want.
- 2 **A style that never generated a bundle can’t be picked** — there is no cover to rebuild. It will carry the current text the first time it generates, so nothing is lost.
- 3 **No email unless you ask for one.** The corrected file reaches the supplier’s folder either way; the digest email is a separate, deliberate choice.

The search covers every client — and that is safe

The number you type is the number you want fixed, whichever client’s tab you happen to have open. A match belonging to a different client is allowed and is **labelled as such**, because its cover prints *that* client’s General information — each style is always rebuilt against its own client’s text, never against the one on screen.

Each style is rebuilt and pushed in turn, so it takes a moment per style, and the result reports **every one of them separately**. “Rebuilt” and “delivered” are

separate facts and either can fail on its own, so a run where one of four failed never renders as a single green tick.

RESULT	WHAT IT MEANS
Rebuilt and delivered	Done. The report names the folder it landed in.
Rebuilt, not delivered	Rebuilt fine, but a gate stopped delivery — no supplier to deliver to, no generated layouts yet, below the supplier-send PO cutoff, or supplier batch-send is switched off. The reason is spelled out, and an armed order waits for the switch.
Rebuilt, delivery failed	Delivery was attempted and failed. Not a success — look at the error and try again.
No cover	Never generated a bundle. Nothing to rebuild.

4 Apply to existing bundles

The broad instrument: rebuild the cover PDF of every style under the client and business area you have open that was generated *before* your edit. Right after a wording change everyone should see; much too broad when one order needs correcting.

It counts the styles first, then asks you to confirm with three choices:

- 1 **Skip styles where every output is approved** — on by default. Their cover shows no status column at all, so rebuilding changes nothing a supplier can see, while still overwriting the file for an order that is already finished. Untick it only if you changed something that shows on *every* cover.
- 2 **Push updated covers to the suppliers' folders** — on by default, overwriting the copy they hold. Untick to refresh the covers in-app only.
- 3 **Skip covers that already say the right thing** — on by default. Each rebuild records what it printed, so a second run costs nothing and a stopped run resumes where it left off.

No supplier is emailed, and there is no option to

Unlike *Regenerate a style*, this tool has no email checkbox at all. The updated file simply becomes the current one in the folder. That is deliberate: a bulk refresh across old orders means the wording changed, not that anybody's order did — and a few hundred emails saying so would be noise.

If a particular supplier genuinely must read the change, use **Regenerate a style** on their order and tick *Also email the suppliers* there.

Either way, outputs and approvals are untouched

Both tools rebuild the **cover PDF** only. No layout is re-rendered, no approval is reset, and nothing is sent back for review.

Which one? If a supplier is holding a PDF with the wrong text for one order, use **Regenerate a style** — type the number, check the list, run it. If you have just rewritten the requirements everybody works to, use **Apply to existing bundles** and leave the defaults alone.
